Glyphosate has been banned and restricted in many countries, cities and towns around the world because of its links to health problems such as cancer, endocrine disruption, kidney failure and many more.

For 20 years, much of Auckland has managed well without chemicals for vegetation control thanks to progressive weed management innovations and the efforts of thousands of people in the 80s and 90s who helped put world-leading policies in place.

But now, the Council has rolled back legacy policies, citing falsified and exaggerated costings and have ramped up the use of **Glyphosate on our roads, parks and playgrounds** – despite its health risks.

WE NEED YOUR HELP TO FIX THIS

Join us in telling the Council that we want chemical-free vegetation management adopted across Auckland!
